

INQUISITIO - Innovation Center

This architectural proposal was conceived as a counterpoint to the contemporary belief that users must abide by the designers will. This new approach takes into account various external factors and uses them as guiding principles, offering an elegant yet functional design that emphasizes transparency, cooperation and permeability through an existing urban fabric...

This proposal was achieved using a parametric definition that adapts to weather conditions and population dynamics within the city. Its curvilinear design is intended to minimize obstructions and allow pedestrians to traverse freely through the courtyard. Its complex membrane follows the trajectory of the sun, thus allowing appropriate lighting at all times and reduces the need for artificial climate control. Exterior terraces are available in the upper levels to allow its users to create flexible work environments that can create a better relationship with the existing environment.
