

The Idea of Ceiling is Amorphous:
What Does Amorphous Mean?
Amorphous means to have no consistent form. When talking about solids, amorphous is the opposite of crystalline. Whereas a crystalline solid is composed of structural patterns, an amorphous solid is not, and has a somewhat unpredictable structural composition. The atoms in an amorphous solid are organized in an irregular fashion.

Movable Wall Detail
One of the effective methods in lowering the ambient temperature and converting hot to cold air is the use of sun-shade. It prevents light from entering the building by absorbing or reflecting sunlight. Installing a canopy reduces the temperature of the house to 11 degrees Celsius. Reduces heat absorption by up to 65% in south windows and up to 77% in east windows.
