

identified problems in the area of Starigrad

- / unfiltered waste water flows directly into the sea / how can this location be attractive if we exclude swimming as a water activity / treating the sea more as a visual aspect, rather than summer attraction
- / **the sea as the visual**; establishing a connection between mountain and the sea as well as summer and winter in the form of bridging the obstacle by using the sea all year around as an object for observation
- / non-use of renewable energy sources / how to activate the area in terms of green energy / favorable orientation for solar power plants; buildings can be energy efficient
- / energy development of the town / Croatia strives for energy development; there are resources; good orientation for solar gains; green buildings to highlight natural characteristics of the environment
